

Abstract

A motorcycle (10) includes a head pipe (15) that supports a steering shaft to rotationally move freely, a body frame (11) connected to the head pipe (15), and an engine (12) supported by the body frame (11) in a suspended state. The body frame (11) includes a main frame (19) that extends obliquely downward to the rear from the head pipe (15) and a pair of left and right sub-frames (20) that extend obliquely downward to the rear from the main frame (19). The engine (12) includes a crankcase (12b) and a cylinder (12a) that extends obliquely upward to the front from the crankcase (12b). The cylinder (12a) is supported by a rear end (19b) of the main frame (19). The crankcase (12b) is supported by portions in two places separated to the front and the rear in the respective sub-frames (20).
